## SM7561

## RS485 current and voltage magnet type small volume wide range

## illuminance sensor

User Manual

## File Version：V21．6．10

SM7561 using the standard ，easy access to PLC，DCS and other instruments or systems for monitoring Illuminance state quantities．The internal use of high－precision sensing core and related devices to ensure high reliability and excellent long－term stability，can be customized
RS232，RS485，CAN，4－20mA，DC0～5V10V，ZIGBEE，Lora，WIFI，GPRS and other output methods．
Technical Parameters

| Technical parameter | Parameter value |
| :--- | :--- |
| Brand | SONBEST |
| Illuminance measuring range | $0 \sim 100000 \mathrm{Lux}$ |
| Illuminance allow deviation | $\pm 7 \%$ |
| Repeatability test | $\pm 5 \%$ |
| Illuminance detection chip | Import digital |
| Wavelength range | $380 \mathrm{~nm} \sim 730 \mathrm{~nm}$ |
| Interface | RS485／4－20mA／DC0－5V／SWITCH |
| Power | DC12～24V 1A |
| Running temperature | $-40 \sim 80^{\circ} \mathrm{C}$ |
| Working humidity | $5 \% R \mathrm{RH} \sim 90 \%$ RH |

## Product Selection

Product DesignRS485，4－20mA，DC0－5V，开关量 Multiple output methods，the products are divided into the following models depending on the output method．

| Product model | output method |
| :--- | :--- |
| SM7561B | RS485 总线 |
| SM7561M | $4-20 \mathrm{~mA}$ |
| SM7561V5 | DC0－5V |
| SM7561S | 开关量（继电器常开点） |

In the case of broken wires，wire the wires as shown in the figure．If the product itself has no leads，the core color is for reference．

## Communication Protocol

The product uses RS485 MODBUS－RTU standard protocol format，all operation or reply commands are hexadecimal data．The default device address is 1 when the device is shipped，the default baud rate is 9600，8，n， 1

1．Read Data（Function id 0x03）

Inquiry frame (hexadecimal), sending example: Query 1\# device 1 data, the host computer sends the command:01 030000000184 0A .

| Device ID | Function id | Start Address | Data Length | CRC16 |
| :--- | :--- | :--- | :--- | :--- |
| 01 | 03 | 0000 | 0001 | 840 A |

For the correct query frame, the device will respond with data:010302007979 A6, the response format is parsed as follows:

| Device ID | Function id | Data Length | 数据 1 | Check Code |
| :--- | :--- | :--- | :--- | :--- |
| 01 | 03 | 02 | 0079 | 79 A6 |

Data Description: The data in the command is hexadecimal. Take data 1 as an example. 0079 is converted to a decimal value of 121 . If the data magnification is 100 , the actual value is $121 / 100=1.21$. Others and so on.
2. Data Address Table

| Address | Start Address | Description | Data type | Value range |
| :--- | :--- | :--- | :--- | :--- |
| 40001 | 0000 | 1\#llluminanceregister | Read only | $0 \sim 65535$ |
| 40101 | 0064 | model code | read/write | $0 \sim 65535$ |
| 40102 | 0065 | total points | read/write | $1 \sim 20$ |
| 40103 | 0066 | Device ID | read/write | $1 \sim 249$ |
| 40104 | 0067 | baud rate | read/write | $0 \sim 6$ |
| 40105 | 0068 | mode | read/write | $1 \sim 4$ |
| 40106 | 0069 | protocol | read/write | $1 \sim 10$ |

## 3 read and modify device address

## (1) Read or query device address

If you don't know the current device address and there is only one device on the bus, you can use the command FA 030064000290 5F Query device address.

| Device ID | Function id | Start Address | Data Length | CRC16 |
| :--- | :--- | :--- | :--- | :--- |
| FA | 03 | 0064 | 0002 | 905 F |

FA is 250 for the general address. When you don't know the address, you can use 250 to get the real device address, 0064 is the device model register.

For the correct query command, the device will respond, for example the response data is: 010302 0712 3A 79, the format of which is as shown in the following table:

| Device ID | Function id | Start Address | Model Code | CRC16 |
| :--- | :--- | :--- | :--- | :--- |
| 01 | 03 | 02 | 553 C 00 01 | 3 3 79 |

Response should be in the data, the first byte 01 indicates that the real address of the current device is, 553 C converted to decimal 20182 indicates that the current device main model is 21820 , the last two bytes 0001 Indicates that the device has a status quantity.

## (2)Change device address

For example, if the current device address is 1 , we want to change to 02 , the command is:01 060066 0002 E8 14 .

| Device ID | Function id | Start Address | Destination | CRC16 |
| :--- | :--- | :--- | :--- | :--- |
| 01 | 06 | 0066 | 0002 | E8 14 |

After the change is successful, the device will return information: 020600660002 E8 27, its format is parsed as shown in the following table:

| Device ID | Function id | Start Address | Destination | CRC16 |
| :--- | :--- | :--- | :--- | :--- |

| 01 | 06 | 0066 | 0002 | E8 27 |
| :--- | :--- | :--- | :--- | :--- |

Response should be in the data, after the modification is successful, the first byte is the new device address. After the general device address is changed, it will take effect immediately. At this time, the user needs to change the query command of the software at the same time.

## 4 Read and Modify Baud Rate

(1) Read baud rate

The device default factory baud rate is 9600 . If you need to change it, you can change it according to the following table and the corresponding communication protocol. For example, read the current device's baud rate ID, the command is:01 030067000135 D5, its format is parsed as follows.

| Device ID | Function id | Start Address | Data Length | CRC16 |
| :--- | :--- | :--- | :--- | :--- |
| 01 | 03 | 0067 | 0001 | 35 D5 |

Read the baud rate encoding of the current device. Baud rate encoding: 1 is $2400 ; 2$ is $4800 ; 3$ is 9600 ; 4 is $19200 ; 5$ is $38400 ; 6$ is 115200 .

For the correct query command, the device will respond, for example the response data is: 010302 0003 F8 45, the format of which is as shown in the following table:

| Device ID | Function id | Data Length | Rate ID | CRC16 |
| :--- | :--- | :--- | :--- | :--- |
| 01 | 03 | 02 | 0003 | F845 |

coded according to baud rate, 03 is 9600 , ie the current device has a baud rate of 9600 .
(2)Change the baud rate

For example, changing the baud rate from 9600 to 38400 , ie changing the code from 3 to 5 , the command is: 010600670005 F8 160103006600016415 .

| Device ID | Function id | Start Address | Target Baud Rate | CRC16 |
| :--- | :--- | :--- | :--- | :--- |
| 01 | 03 | 0066 | 0001 | 6415 |

Change the baud rate from 9600 to 38400 , changing the code from 3 to 5 . The new baud rate will take effect immediately, at which point the device will lose its response and the baud rate of the device should be queried accordingly. Modified.

## 5 Read Correction Value

## (1) Read Correction Value

When there is an error between the data and the reference standard, we can reduce the display error by adjusting the correction value. The correction difference can be modified to be plus or minus 1000, that is, the value range is $0-1000$ or $64535-65535$. For example, when the display value is too small, we can correct it by adding 100. The command is: 010300 6B 0001 F5 D6. In the command 100 is hex $0 \times 64$ If you need to reduce, you can set a negative value, such as -100 , corresponding to the hexadecimal value of FF 9C, which is calculated as $100-65535=65435$, and then converted to hexadecimal to $0 x$ FF 9C. The correction value starts from 006 B . We take the first parameter as an example. The correction value is read and modified in the same way for multiple parameters.

| Device ID | Function id | Start Address | Data Length | CRC16 |
| :--- | :--- | :--- | :--- | :--- |
| 01 | 03 | 006 B | 0001 | F5 D6 |

For the correct query command, the device will respond, for example the response data is: 010302 $0064 \mathrm{B9}$ AF, the format of which is as shown in the following table:

| Device ID | Function id | Data Length | Data value | CRC16 |
| :--- | :--- | :--- | :--- | :--- |
| 01 | 03 | 02 | 0064 | B9 AF |

In the response data, the first byte 01 indicates the real address of the current device, and 006 B is the first state quantity correction value register. If the device has multiple parameters, other parameters
operate in this way. The same, the general temperature, humidity have this parameter, the light generally does not have this item.

## (2)Change correction value

For example, the current state quantity is too small, we want to add 1 to its true value, and the current value plus 100 correction operation command is:01 0600 6B 0064 F9 FD.

| Device ID | Function id | Start Address | Destination | CRC16 |
| :--- | :--- | :--- | :--- | :--- |
| 01 | 06 | $006 B$ | 0064 | F9 FD |

After the operation is successful, the device will return information: 010600 6B 0064 F9 FD, the parameters take effect immediately after successful change.

For example, the range is $0 \sim 100000 \mathrm{Lux}$, the analog output is $4 \sim 20 \mathrm{~mA}$ current sig nal, Illuminance and current The calculation relationship is as shown in the formula: $\mathrm{C}=(\mathrm{A} 2-\mathrm{A} 1)^{*}(\mathrm{X}-\mathrm{B} 1) /(\mathrm{B} 2-\mathrm{B} 1)+\mathrm{A} 1$, where A2 is Illuminance range upper limit, A1 is the lower limit of the range, B2 is current output range upper limit, B 1 is the lower limit, X is the currently read Illuminance value, and C is the calculated current value. The list of commonly used values is as follows:

| current(mA) | IlluminanceValue (Lux) | Calculation Process |
| :--- | :--- | :--- |
| 4 | 0.0 | $(100000-0)^{*}(4-4) \div(20-4)+0$ |
| 5 | 6250.0 | $(100000-0)^{*}(5-4) \div(20-4)+0$ |
| 6 | 12500.0 | $(100000-0)^{*}(6-4) \div(20-4)+0$ |
| 7 | 18750.0 | $(100000-0)^{*}(7-4) \div(20-4)+0$ |
| 8 | 25000.0 | $(100000-0)^{*}(8-4) \div(20-4)+0$ |
| 9 | 31250.0 | $(100000-0)^{*}(9-4) \div(20-4)+0$ |
| 10 | 37500.0 | $(100000-0)^{*}(10-4) \div(20-4)+0$ |
| 11 | 43750.0 | $(100000-0)^{*}(11-4) \div(20-4)+0$ |
| 12 | 50000.0 | $(100000-0)^{*}(12-4) \div(20-4)+0$ |
| 13 | 56250.0 | $(100000-0)^{*}(13-4) \div(20-4)+0$ |
| 14 | 62500.0 | $(100000-0)^{*}(14-4) \div(20-4)+0$ |
| 15 | 68750.0 | $(100000-0)^{*}(15-4) \div(20-4)+0$ |
| 16 | 75000.0 | $(100000-0)^{*}(16-4) \div(20-4)+0$ |
| 17 | 81250.0 | $(100000-0)^{*}(17-4) \div(20-4)+0$ |
| 18 | 87500.0 | $(100000-0)^{*}(18-4) \div(20-4)+0$ |
| 19 | 93750.0 | $(100000-0)^{*}(19-4) \div(20-4)+0$ |
| 20 | 100000.0 | $(100000-0)^{*}(20-4) \div(20-4)+0$ |

As shown in the above formula, when measuring 8 mA , current current is 25004 Lux 。

For example, the range is $0 \sim 100000 \mathrm{Lux}$, the analog output is $0 \sim 5 \mathrm{~V}$ DC0-5Vvoltage signal, Illuminance and DC0-5Vvoltage The calculation relationship is as shown in the formula: $\mathrm{C}=(\mathrm{A} 2-\mathrm{A} 1)^{*}(\mathrm{X}-\mathrm{B} 1) /(\mathrm{B} 2-\mathrm{B} 1)$ + A1, where A2 is Illuminance range upper limit, A1 is the lower limit of the range, B2 is DC0 -5 V voltage output range upper limit, B 1 is the lower limit, X is the currently read Illuminance value, a nd C is the calculated DC0-5Vvoltage value. The list of commonly used values is as follows:

| DC0-5Vvoltage(V) | IlluminanceValue (Lux) | Calculation Process |
| :--- | :--- | :--- |
| 0 | 0.0 | $(100000-0)^{*}(0-0) \div(5-0)+0$ |
| 1 | 20000.0 | $(100000-0)^{*}(1-0) \div(5-0)+0$ |

| 2 | 40000.0 | $(100000-0)^{*}(2-0) \div(5-0)+0$ |
| :--- | :--- | :--- |
| 3 | 60000.0 | $(100000-0)^{*}(3-0) \div(5-0)+0$ |
| 4 | 80000.0 | $(100000-0)^{*}(4-0) \div(5-0)+0$ |
| 5 | 100000.0 | $(100000-0)^{*}(5-0) \div(5-0)+0$ |

As shown in the above formula, when measuring 2.5 V , current DCO-5Vvoltage is 50000 Lux 。
